comments (0)

Welcome to Ray's Blog page.

Ray has come on board and will continue to write blogs for you to read and interact with. Having being a part of TUFOIC for a very long time, his knowledge on the UFO subject is immense.

VUFOA welcomes you Ray and we hope our readers join in with a chat or two with you.

Andrew & Ben

## Introduction

Posted by tufolib on January 12, 2014 at 12:55 PM

This is my first blog –

It is very important that this section should not be used for hypotheses and speculation as there are other areas of the VUFOA site for personal views. Many people will see the same event differently from others due to different cultural influences.

To remain concise or efficient, only known facts and accurate descriptions of events – even potential misinterpretations, at or immediately after the time of viewing should be included, however short in time or detail. In my own sighting in 1978, I had up to 8 seconds to view very accurate details of lights in the night sky. A good memory for exact detail helps significantly!

Research must be done by contributors before submitting articles or basic information. It is easy to verify 'trusted' facts on the Internet by typing key words into search engines. References – and contacts with 'trusted' authors, from other sites must always be given at the bottom of articles so other people can do their own research.

This is the most effective way that people can learn – and limit the amount of paperwork I will have to do! Each author only deals with a minimum of one person – themselves, but I might have to deal with anything up to hundreds of VUFOA members – and hundreds of witnesses and investigators in the future.

Subjects should be related in any way to ufology, but they can also have descriptions that appear to be like other objects or experiences. If something is shaped like a crescent Moon or moves like a balloon in a changing wind flow, then that will be important to an investigation or report.

## Lights in the Sky (30 December, 1978)

Posted by tufolib on January 12, 2014 at 3:45 PM

About 11.00pm (Tasmanian Summer Time or Daylight Saving Time, 10.00pm Australian Eastern Standard Time and 1200 Coordinated Universal Time) on 30 December 1978, two sets of three bright star-sized lights, each in a close-knit triangle, flew on horizontal trajectories over the Tasman Sea, taking about ten seconds to cover the full extent of the horizon as viewed from Princes Wharf 1 in Hobart, Tasmania.

The first set flew in a SSE direction, taking a few seconds to travel from a point directly above my head, and away from my direction of viewing, until I could no longer see it, but I can't remember if it simply faded with distance. The second set followed in a SSW direction a few seconds later – about the time the first one decreased in visibility. It crossed the path of the first set to create an X like a game of Noughts And Crosses in the black, night sky.

This was several days after the first UFO sighting in New Zealand on 21 December 1978, and about the same time as the plane flight, which carried a New Zealand television crew on 30 December 1978. Their story appeared on national television as well as other forms of electronic and printed media!

A friend who was with me at the very noisy and bright Hobart summer festival, which included sideshows, flatly refused to look at what I was telling him about, and kept his eyes firmly on me! Who could blame him? This incident was the beginning of a now very-long hobby in ufology! Someone south of Hobart also made a report of one, the other or both lights, which headed in that direction after passing over Hobart. I don't know which.

This incident may have been an obsession for the first two days, but I still had my existing life to live!

I still have my very detailed personal investigation on two double-sided foolscap sheets of paper, but will probably never discover what these rapid sets of controlled lights in a triangle were. I noticed the second set as having two static, white, star-sized lights on top, and one slightly dimmer, possibly yellowish light underneath, which pulsed slightly at about one cycle per second. I had five seconds to notice the second one, and eight seconds to notice both!

The velocities and arrangements of these two sets of lights still baffle me when I try to match them to any aircraft that is familiar to me. Two days later, a local television news reporter said they were "light aircraft", but I know better, having worked out different speeds at different altitudes for different aircraft types! Nothing matched what I saw!

The previous version of this – now with photos of the location, is here –

## Profile of Ray Thomas

Posted by tufolib on January 19, 2014 at 7:45 AM

Who is this contact for Tasmania who is 'alien' to the Australian state of Victoria?

None other than the Librarian for the Tasmanian UFO Investigation Centre (TUFOIC). That was formed in October 1965, but I have only been in it since the 1980s, having seen my first unidentifiable pair of UFOs in December 1978.

My first 'UFO' was a trail of white smoke about 1963, but much more recently, I read about that as being an American test plane called the X-15, I think it is called. I have also had an interest in aliens for that long, but I still haven't met anyone who has claimed to be one!

-----

Since my early childhood, I have loved to pull things apart to see how they worked. Not only that, I have also been rarely satisfied with the way in which commercial products operated, so I started building my own equipment in 1964. I also became a model-maker then, but it wasn't until the early part of the 21st Century that I labelled myself as the "Master of Modification".

However, I quite often need instruction and repair manuals to work out what something is supposed to do, especially when it doesn't because of minor faults – or a complete breakdown! A great deal of equipment has either been returned to over-hopeful owners or is now on the tip!

More of it clogs my sheds, but more still has been thrown out! I just don't need to repair most things now.

-----

One of the things that hasn't worked properly is modern society because of its refusal of the overall acknowledgement of the existence of UFOs and aliens! Like all things that I come in contact with, I feel the need to rectify situations to suit my own curiosity. Being a compassionate person, I do not like people in high places treading on us little people!

In December 1988, I began teaching myself industrial design for the community to the point where my persistence has put me in a very privileged position. I have basic University experience in a wide range of fields, but have never studied in a full capacity! Science has been my first love since I was introduced to astronomy in Grade 5 in 1962.

People from all walks of life – from Government departments, businesses and private organisations right down to children have asked to me fix something in their lives.

That often leads to equipment I have never seen before, and have no repair manuals to assist in understanding what is supposed to happen. We all have our limits and can't help people who expect more than what we have been taught.

-----

That brings us to the present where Governments not only don't tell us their secrets, but they feed us false information to throw us off their tracks. That's where I come in, being a whistleblower and investigator of secrets from way back – since primary school, I believe!

I haven't liked school since Grade 1, or organised religion – ever! That's because I was never taught in the way that suited me! It wasn't until I left high school that I began to learn more of the relevant things about life than school ever did. Of course, the brutality of the 1950s and 1960s did leave me with a very good grasp of the English language, but I still wanted to teach myself more of what I was interested in, especially from the 1980s onwards.

Since then, I have become a writer with more than reasonable experience, trapping people into reading until they have actually told me that they can't put my work down after picking it up! Once again, I want to improve what I do because I used to be a perfectionist. Recognition of my writings goes back to the Headmaster in 1962.

-----

My curiosity these days is filled with the workings of gravity, light and UFO propulsion more than the Universe where we live! Most importantly, I like to concentrate on Earth and Mars, along with their Moons, which have more 'secrets' than Governments have been telling us about!

Despite working with some very inventive people – male and female, adult and child, I have never met anyone who has basic knowledge in most fields of science, the occult and ufology! In fact, everything in this Universe is science to me, but some of it is just beyond the imagination of most people!

The word 'science' means to study, and is not the cultural opposite of religion! While I am almost envious of scientists with degrees and diplomas, they are in absolute awe at what I know from 50 years of self-taught knowledge! I have to put it that way, having often noticed their jaws hanging down 'around their ankles' when I am talking to them!

I have lots of time, not having had a job since early 1987. Industrial poisoning in 1980 is partly the cause of that! The rest was being born with an allergy to hydrocarbons! Now, I concentrate on Government 'poisoning', which is preventing modern society from advancing humanity!

## 3 States of Thought

Posted by tufolib on January 27, 2014 at 7:30 AM

### 3 States of Thought –

1. Hypothesis – An imagination, inspired by a present situation.
2. Theory – A willing belief that this is how things should be!
3. Conclusion – No doubt about it, disregarding inconsistencies!

Without imagination, humans would not be human! It is every person's right to imagine whatever they want – as long as they don't take it seriously! I learned a long time ago that nothing in this Universe is what it appears to be!

Another human trait is obsession, which can overpower human thought so much, the brain often becomes confused – to the point of sheer arrogance! Too many 'scientists' have suffered from this serious affliction, and should have known better!

Most people on Earth still make conclusions without ever having performed research to back up their blind beliefs in what other people have stated – people who also haven't properly investigated what they are telling others!

### 4th State of Thought –

Awareness, consciousness – higher plane of existence, if you like!

All it takes to be reasonable about any subject is to stop and think about it – not in the immediate term, but over

many years! The same situation often looks different the next time you look at it! A sunset still basically has the same parts to it – atmosphere, clouds, dust, water vapour – and you, an individual observer who has never lived and been influenced by exactly the same life as someone else!

Knowing why changing sunsets occur requires a great deal of specific education about the Earth's atmosphere! Unless people have actually been up there – without a plane, they cannot possibly know exactly what it is like! There are no words to describe their true feelings, especially as the same situation feels different to each individual!

No two people are exactly alike, and no two people experience the same situation the same way! Do not immediately rule out what someone says, but it is okay to question in an effort to gauge for yourself how misinterpretation could occur!

It is only when people investigate evidence, which remains that conclusions can be drawn – and then, differences are still observed at different times. One example is a spinning 'UFO' that changed many colours, which it actually appeared to do for me. However, it was only a star 'twinkling' in the atmospheric pollution just over a low mountain top!

The location of this 'anomaly' was confirmed immediately on checking a star chart! My conclusion is therefore justified.

## Shield

Posted by tufolib on January 27, 2014 at 5:05 PM

I can't get you out of my head!

Someone wrote a song about that once, but what I really mean is that a picture I once saw depicted a UFO that was very close to the Earth's Sun, and was interacting with it in some way.

The point is that it would take a powerful mechanism of some sort to reflect all of the damaging frequencies of light, X-rays and other energy to prevent the UFO from melting.

Regardless of whether or not this depiction refers to a real-life situation, I find the idea very fascinating. It makes me think hard about the possibilities, which the human race still does not understand.

We may simply be 'Neanderthals' in a world of advanced races of people, but many of us can still live in seemingly-intolerable conditions.

Maybe it is us who have advanced, even though we have lost many traits attributable to early humans. They adapted very well to this world most suited to plants and animals.

## Transportation

Posted by tufolib on January 28, 2014 at 4:20 PM

Having a very strong interest in physics, but no qualifications for at least 50 years, how do I think transportation works on Star Trek's "U.S.S. Enterprise"?

Every bit of information about a living being would have to be mapped to the last detail. That means not only knowing about every chemical combination in every cell, but also every firing sequence in every neuron of a brain to retain a lifetime of memories.

If a transporter disassembles every part of a human body, turning it into atoms and energy, all of those details

would have to be stored in the Enterprise's computer, and then reassemble that configuration – probably in the opposite sequence as it was disassembled.

Electronic computers are incapable of storing organic molecules, which are clusters of different atoms and their energies! The person being transported would never again be exactly the same one as before! They would only be clones of what they were originally!

The computer might have to take pure hydrogen atoms from the Universe and correctly configure them to create all of the molecules. If you want to be the real you forever, don't sign up for the Star Trek program!

## Star Material

Posted by tufolib on January 31, 2014 at 9:40 AM

### Atomic Absorption of Information By Our Brains –

Splitting an atom in a Hadron Collider is only the beginning of our understanding in advanced physics!

I still haven't properly investigated the birth of stars, where they really come from and if the supply of atoms is finite! If there was a Big Bang, there was probably only a certain amount of material to create what is now our expanding Universe!

Are new atoms created all the time? I don't think so because one of the unwritten rules of the Universe is that you can't create something from nothing – especially energy! You can only transfer it from one form to another – and only see the effects of its presence, not the actual energy itself!

It seems to me that stars are created only from existing material, whether it be parts of atoms originally, or from hydrogen atoms themselves. Of course, I will never know all that many astrophysicists do, but with their help, I can greatly advance my knowledge in the field that was introduced to me in Grade 5 in 1962 by my all-time favourite teacher!

Introducing my first love in science as astronomy was not the reason – in fact, I felt that I had been deprived of important information. It was actually her personality and acceptance of me! My love of astronomy may have wavered a bit over the years, but it is as strong now as it was nearly 52 years ago!

However, it isn't as strong now as when I drove my science teacher mad with excessive amounts of homework in high school two years later!

## Moon Dome

Posted by tufolib on February 21, 2014 at 1:50 PM

Who has heard of the shattered crystal dome on the Moon? How could tonnes and tonnes of material remain suspended above the surface for so long?

Could it be static electricity that is never discharged because of a lack of enough atmosphere, which would normally provide a path? We were told that no atmosphere was present, but someone recently said there still is one in a minuscule amount!

However, I can only imagine that this static electricity is topped up by the solar wind or particles, both of which travel through the dome's many millions of fragments.

Gases will break down into plasma in a very high voltage, but if neither exists, there would be nothing for electricity to travel on. I have done exactly the same thing with polystyrene beads after charging them up with static electricity! It's amazing to see them just floating in 'space'!

I'm glad I thought of this possibility because it's been on my mind for a couple of years! A lack of atmosphere would also explain why a supposed tower – several kilometres high, has never collapsed.

Of course, meteors missing it and no weather to blow it down has been a great help! Not so, the shattered crystal dome, which I believe suffered a direct hit from at least one small meteor strike!

Having heard about occasional flashes of light on the Moon being noticed by astronomers on Earth, it seems logical that these glints would come from the crystal skyscrapers that are also said to adorn the surface!

## Underground Tunnels

Posted by tufolib on February 24, 2014 at 5:55 AM

Many years ago, Phil Schneider told us that the Swiss Alps are riddled with tunnels going in all directions. If no one digging one tunnel knew where the locations of others were because of high security, wouldn't that be similar (or worse) to termites hollowing out trees and buildings?

This is not fracking here where other material is replaced after drilling holes in the Earth – this is like a matrix of irregularly shaped cells, which would create less and less stability!

How long will that go on before the Swiss Alps collapse in a monumental pile of rubble, wiping out all of the inhabitants said to be living inside those tunnels?

Area 51 in New Mexico is not supposed to exist because it isn't on any public map, but the Swiss Alps simply may not exist at all in the future if all that has been said is true!

## Belief and Disbelief

Posted by tufolib on March 4, 2014 at 8:35 AM

**Why do people disbelieve in UFOs, see something unusual, then suddenly believe in aliens from outer space?**

I think it might be because no one has been given all of the information necessary to make fully-informed decisions. In fact, no one will ever have all of the answers if they were able to live forever! I have asked the question above because I simply do not have enough knowledge about ufology, the occult and even this Earth itself!

What everyone must know is that I have been studying ufology for 34 years, the occult at drive-in theatres for about 10 years and high school physics for 50 years. However, I have only just been learning a great deal more about gravity and light in very recent times.

Until now, I have only had very vague ideas of what scientists were describing for the general public – and better ideas from images they created, but those still turned out to be only a very small part of the story!

It was easy for me to accept in science as 'truth' what I was taught in high school, but later on, not everything seemed to fit into my own little boxes, the shapes of which were often different from modern society's. Because of that, I began to notice inconsistencies in what was being taught.

Having experienced that from all walks of life for well over 50 years, I began to self-educate myself – gaining the

## Location, Location, Location

Posted by tufolib on March 13, 2014 at 7:55 AM

Although many parts of Australia experienced a significant increase in UFO sightings in the latter half of the 20th Century, I have never seriously investigated the reasons for that.

However, after a few decades of occasional to close and prolonged observations, I believe that nuclear power and weaponry are very attractive to this type of craft's occupants. The source of these two aspects of modern life appear to be the reason why Tasmania no longer attracts most of the sightings. They are now centred around military bases in most of Australia's states.

Back then, it's as though many craft were flown over Tasmania to investigate the 'unknown'. One reason we don't have nuclear power is the potential and occurrence of accidents in industries and defence forces. Tasmania also does not have the space to store the massive amount of waste that is produced – and it can't be stored safely forever!

For all of those very reasons, there is really no room on this Earth for nuclear power at all, especially after what has happened in the U.S., Russia and Japan! Thermal energy has been allowed to dissipate instead of replacing potentially lethal technology, which is still not fully understood by anyone!

Technology being what it is, no one is knowledgeable enough or fully prepared for the consequences that occur too often, not the human race – or entities living beyond this earth, as many people believe exist. I won't discuss this last matter here as that is not specifically related to the use of nuclear energy.

## Pulls of Water

Posted by tufolib on March 20, 2014 at 8:25 AM

Can gravity and magnetism affect bodies of water?

Oh, yes! Anyone who has ever studied the tides in great detail will be familiar with the reason why Earth's seas rise and fall about twice a day!

If you take a small magnet intended only for playing with and put it next to a stream of vertically running water – from a tap, beaker, jug etc., you won't notice any effect, probably because the magnetism is too weak to radiate very far beyond the magnet itself.

However, when electromagnetic energy is present, weird things happen! Gravity by itself is overcome very easily by using items not usually thought of as being magnetic! These include nylon and other plastic objects of any shape and size. Even aluminium can become magnetic when moved through magnetic waves!

Followers of religion will be familiar with the parting of the tides, but how could anyone possibly do that? The answer lies again in electromagnetic energy! Immediate thoughts within my present knowledge of intermediate physics (not high school or advanced) lead me to think that I could part water in a dish into two bodies with a reasonably dry gap in the middle using two sources of energy!

How could I possibly do this? I could place one energy source on one side of a small lid and a second source on the other side of it. For example, if I were to charge up two nylon rods and place them 180 degrees apart around that lid, would that work?

I haven't tried this yet, but I would like people inspired enough to do so for themselves! Two plastic combs and

someone's very dry hair will work like 'miracles'. A small, plastic lid with a thin film of water in the bottom might yield good results, but I will leave that up to you to find out!

Come to think of it, what would happen if the lid was not upside-down with about half a teaspoon of water inside it, but the right way up with a few drops of water placed on top? Would there be a difference between tap water with minerals and pure water containing only hydrogen and oxygen?

I know the first one conducts electricity very well and the second one would, but a great deal less! However, everything in this Universe has its limits and will break down under extreme forces, relative to each situation.

For more information about gravity and magnetism, I found this Web site very interesting, despite conflicting beliefs –

<http://antigravitypower.tripod.com/magnetism/index.html>

## Memories Are Made Of These

Posted by tufolib on April 4, 2014 at 10:40 AM

The properties of UFO materials are not really unusual, considering what we have here on Earth nowadays!

For many years now, there have been memory metals containing nickel and titanium – two very well-known elements in the Periodic Table. When these metals are formed using heat, they can be moulded into specific shapes for different uses.

When they are at room temperatures, they are still very flexible, and can be bent into many different shapes. However, when they are placed in cups of hot water, they immediately return to the original shapes they were created in.

Just as much fun are the bags that potato chips and other junk foods come in. After having your body invaded with extraterrestrial substances covered in salt, you can now screw the bags up, but don't expect them to remain in that state!

As soon as you let them go, they will immediately return to how they came with the foods in them! Investigating UFOs (unusual food oddities) is lots of fun!

P.S. Both the food and the salt are extraterrestrial in origin, but not alien – one lives underground and the other is found below the surface of the sea.

## Now See Here!

Posted by tufolib on April 15, 2014 at 9:30 AM

As no one can ever see or feel an event in the same way as someone else, that is how I will present this article. There may be times when people think they do – especially regarding mental telepathy or genetic make-up, but deep down inside, no two people are alike!

Time – especially in duration more than chronology, can feature prominently in interpreting or misinterpreting an event. So can light levels, along with the usual education in schools, their different systems, religions and upbringing by parents, guardians, nannies, siblings and friends – or none of these! People see life differently, which results in different interpretations of events.

For me, something I thought I saw a few seconds ago does not always turn out to be the same a few seconds later! Having thought for a long time about this, I can only theorise using well over 50 years of extensive self-taught education!

Science has been my first obsession since I was introduced to it in primary school, but what I really wanted to know was either unknown to – and ignored by teachers at that time or was because there was no one else except my older brother who was willing to spend a lot of time sharing his acquired knowledge! Early in our childhoods, he became a 'maths freak', but I became a 'science freak'.

I tell people that I had a weird childhood because I had experiences that medieval village residents would have burned me at the stake for! However, I will only concentrate here on interpretations of my present physiology – like eyes and brain, for example.

Sometimes, I don't react when people approach me because they are standing between me and a source of light – usually daylight through a doorway or the Sun. Anyone who has a camera has experienced this many times where the background is brightly lit and the subject is facing away from the light, causing a shadow to appear on one side of them, usually the front with their face.

This is demonstrated in this number (88), where the 'person' outside the doorway and farther back (on the right) is illuminated from the front and the 'other' (inside the doorway) on the right is illuminated from the back, causing a shadow. This has also happened for me in the open flap of a large tent where one person was just outside. The sky provided the backdrop to this 'shadow of a man'.

Flashbacks can return me to my past for a few seconds or more, given my amazing deep memory for certain events, but that doesn't necessarily mean I'm special in any way – this is just another human trait, which many people don't understand. It frightens some, but there is no need to feel that way! It's just the way our very unimaginably complicated brains work! It's no wonder present Earth science has not been able to artificially reproduce one!

Back to my eyes! There are floaters inside the human eye (at least) – body cells that are replaced by newer ones because they age, die and break off from the surface of the retina. These look a bit like translucent UFOs when they float around the fluid in front of the retinal cones, but I am not trying to debunk any one case here! It's just something I have noticed thousands of times!

Flashes of light appear when an eye is inadvertently moved by contact with something outside the body. It is absolutely imperative that this be prevented as much as possible because sight is one of the 'miracles' of the Universe and must be cared for at all costs! Once it's gone for good, it can't always be returned.

However, I have noticed this being done while touching some kind of liquid crystal display, which immediately forms a 'black glow' around a finger. I can't get it to work on my laptop or calculator, but it has occurred somewhere else. The point is that photons of light – or false visual effects can be produced by means other than by intended sources! What appears to be the direct source isn't necessarily the case!

## Hot and Cold Running Light

Posted by tufolib on April 29, 2014 at 8:00 AM

Only in recent times did I read about one version of the Min Min Lights as being a swarm of small fireflies that have puzzled many people in the past.

Bioluminescence is the ability for life to create light without the heat that we usually associate with it – like light globes, radiators and fire or stars! Now we have Light Emitting Diodes – otherwise known as LEDs, which are made from earth-based chemical combinations to give us several colours.

However, animals and plants often use oxygen to create their light, but ours doesn't. Light, as I have heard it being

described as, is the way in which atoms – or more specifically, their electrons, are excited in a different way to just being atoms!

Unless we know more about the way in which light has been utilised, reports of UFOs – both hovering and landed, will continue to be reported as such. I learned a long time ago that nothing in this Universe is what it appears to be, and most of what we even know about is still being misinterpreted.

In fact, "UFO" is not always the right acronym for these craft unless they are "unidentified floating objects" or "...organisms" because some of them are constructed and operate in ways, which are not the same as birds and planes. They don't always fly if they don't have wings that rely on moving air – they pass through many mediums seemingly as easily as we move our arms and legs at will.

It appears that every UFO does not come from outer space – or all occupants are alien! Until everyone gets to meet the flight crews of these mostly elusive craft, there will be places for UFO organisations and their members for many years to come.

That leads me to the question of "What will happen to us when we finally have all of the answers?" Knowing how we haven't even scratched the surface of this Universe (so to speak), that will never happen if we all get to live forever!

## Glowing Attributes

Posted by tufolib on May 9, 2014 at 9:35 AM

In addition to my article entitled "Hot and Cold Running Light", there are aspects of light itself, which most people don't understand. Until recently, I had no idea what light is – or what it can really do!

Light is just another form of energy – like heat, sound, magnetism, gravity – and radio waves, as people imagine as having the most basic knowledge of them! Without some kind of investigation, it is impossible to know what energy might be – and then I don't know anyone who really knows either. Even Albert Einstein worked with theories, so he was never able to 'fit the Universe in a nutshell', so to speak!

Most people don't realise that light is one of the forms of energy that has been around since the beginning – or maybe reconstitution, of the Universe! That's probably because they haven't stopped to think about it. In any case, I won't discuss the formation of it here, especially as it would probably take forever!

There have been some reports of UFOs with glowing surfaces of crafts – as though the light actually comes from their surfaces, not as if lights are attached to them or mounted behind translucent materials. That is not hard to believe when you think about the technology we have had since the 1900s – and before, I guess!

Who has ever owned a watch with glowing hands and numbers, or dots to represent them? Who has ever bought those glow-in-the-dark mobiles of skeletons, animals or stars? That is called phosphorescence and can be learned about here –

<https://en.wikipedia.org/wiki/Phosphorescence>

Much more recently, I have read about people who claimed to have seen what the movie series, Star Wars, fantasise about – light beams of particular lengths! In this case, they are those light sabres used as weapons!

In some UFO reports, light beams have been said to be of particular lengths due to the beams being suddenly cut off. Not only that, but extending and withdrawing a light beam has been reported in at least one story. This is the best way I can instil an image in your mind. Most people are familiar with building construction or crafts at home.

It may or may not surprise you to know that I have LED and halogen torches that exhibit this very property – to shine a beam of light for a distance of several metres with darkness extending beyond that. I still haven't investigated why this is so, but I imagine focal lengths of a lens on the LED torch and one on the halogen globe having something to do with it.

Both beams do not fade out the way an analogue radio station signal does – it comes out and it stops, suddenly, just like this article!

## What in the World

Posted by tufolib on May 14, 2014 at 11:15 AM

Is it a bird? Is it a plane? It certainly isn't Superman! More often than not, it isn't a UFO either!

A vast number of people on this Earth have no idea what is in the sky above them because they rarely (if ever) look up! In fact, a lesser number of people never get to go outside at all – either through choice, age or disability!

Everyone who is lucky enough to be able to look at the night sky will see some incredible stuff that often remains as mysteries! However, all it takes is a little investigation to discover where the stars and planets are at certain times of each night of every year!

A quick check with your own – or a neighbour's library of space books and computer programs can often quickly dispel theories that bright lights – especially spinning, changing colours and shapes, will turn out to be a UFO, like an alien spacecraft or whatever!

A similar case was referred to me, which was quite spectacular – and yes, this light in the sky certainly was spinning, changing colours and shapes! Looking at my Starry Night Enthusiast computer program, I quickly realised that it was the star called Miaplacidus, which is low in the sky when the Southern Cross is "the right way up". Its distance away is just under four times the height, and to the bottom-right of the Southern Cross.

On one particular night, it was so low in the southern sky that atmospheric pollution was in a line of sight just above the mountain top, which caused it to put on a fantastic light show! To anyone who hasn't studied astronomy – as one person hadn't as much as I and many other people have, it really did look like a UFO hovering in one spot!

This person knew what to do in this circumstance and contacted someone in-the-know! That is always preferable to getting a small light in the black night sky on video – with no reference points to guide investigators, then putting it on YouTube and adding irrelevant music and uninformed commentary and/or subtitles for information – and entertainment!

Ufology is serious stuff and requires serious investigation by trained observers! Some people might be disappointed, but at least a logical – or correct answer often comes out of it.

## Top This!

Posted by tufolib on May 27, 2014 at 8:30 PM

Many people still don't believe in UFOs – even though some of them, now as adults, probably had spinning tops in their childhoods. Maybe they forgot, or have been led to believe that such devices are only meant to be used on the ground.

Where did the origin of this toy come from? No one knows because its use has been around for centuries! Was it inspired by UFOs or was it just another idea from someone who had nothing better to do than create fun for themselves?

I wonder when the functions of these progressed from just spinning around on a horizontal axis to those that I have purchased in the past 30 years or so – a small one from a museum, a larger and much heavier one, which is slower and came from a science shop, and another smaller one from a weekly market recently!

The first, smaller one's bearings are now worn out! I played with it so much by trying to figure out how to defy gravity completely, but so far, all I can achieve is part-defiance by hanging it sideways over a spindle, one edge of a table top, box or whatever!

In one sense, it truly is defying gravity – in part, though! You can hang a stopped gyroscope over the side all you want for a million years, but you will never get it to stay there without a support under one side of it. Smaller and faster gyroscopes defy gravity longer than much heavier ones, which have too much weight in them.

I think the problem here is a lack of magnets – and probably static electricity! I would love to create a machine that defies gravity, but I don't want to kill myself in the process! I have a very long way to go before I am ready to start tinkering with such technology – I haven't even bought a book on it yet! However, I did ask once, but of course, they were out of print.

Given the anxiety the woman in the bookstore had, I was left with the impression that she didn't want me asking about Nikola Tesla's inventions! What did she think I was going to do with them? I never asked again because I don't have the time to build them anyway – and I don't want Australia's police and security organisations knocking on my door!

## Water

Posted by tufolib on June 4, 2014 at 8:40 PM

Did you know that most of us are made of ancient alien materials?

Water is just one of them as it couldn't possibly have come directly from the 'fires' that preceded the formation of Earth! At least, that is my belief! At the moment, it is the only substance I know of that expands when cooled and contracts when heated – and it has a host of other relatively unknown properties as well.

Its molecules have been said to have an attraction to each other, it is basically elastic in nature, but will still stop large, moving objects in their tracks! It is beneficial for life, but will take it away if not used safely!

The two atoms in it – hydrogen and oxygen, can be extremely dangerous in their basic forms! Many adults should know that hydrogen is explosive, and oxygen makes iron seem to 'disappear' into 'thin air'! Hydrogen is phenomenally more dangerous when oxygen is in the same container – especially if it is sealed.

Why would anyone want to drink a liquid containing these two atoms when nutritionists advise us to include antioxidants in our diets to improve health? Without this 'magical' fluid, there would be no life as we know it.

Did I build up an insatiable thirst for you? Grab a glass and fill it with life-giving water, then sit quietly and ponder on the most important substance in the Universe! It is contributing to the knowledge that you are either being reminded of this facet of life – or are you learning this for the first time!

**MARS INVADED BY ALIENS!**

Posted by tufolib on June 22, 2014 at 9:15 AM

## MARS INVADED BY ALIENS!

Will this be the headlines in an electronic newspaper in the near future?

If you have never believed in aliens invading other planets, you had better start now so you will be prepared when human beings from Earth arrive on Mars, probably before the end of the 21st Century!

How many sceptics will we have left after this event occurs? They will at least begin to doubt their own 'beliefs' – or 'disbeliefs', but let some of us not forget that for many decades, one man in India publicly refused to believe that the Apollo 11 Moon mission was successful. Some people still don't, but most do!

Regardless of whatever Albert Einstein – or even H. G. Wells has said about time in the past, it certainly doesn't stand still on Earth. There is always something happening here because someone is always inventing, discovering or rediscovering something somewhere on this planet.

It has been said that we have mapped more of the Moon and Mars than we had of Earth, but that might not be the case now. Many of us know even less about ourselves than we do about our planet. If we live forever, we may still never know everything about our make-up, especially about the alien parts of ourselves!

If you think we aren't aliens already, remember that we have the same atoms that were building stars thousands of millions of years ago! Some of those atoms were formed into molecules of water – one of the most mysterious, known substances in the Universe. I don't believe it formed on Earth out of dust and fire during the birth of this planet. It must have arrived here from space!

## Let's Face It

Posted by tufolib on July 19, 2014 at 5:05 PM

What do you think of when someone says the word "alien"?

It seems that many people immediately think of a long, white or grey face, almond eyes, small mouth and almost no nose!

However, that is not what they were a long time ago! I have heard that they were anyone who wasn't indigenous, or born of naturalised ancestors who arrived in a different country a long time ago!

It is also something that doesn't usually belong there, and can also be a feeling in unfamiliar surroundings!

How many aliens can you think of when someone mentions the subject? Again, it would probably be just the one described above, but having researched this for about two decades, I have heard and/or read about claims that as many as 57 species have been encountered.

Remember, this is only what I have heard and/or read about, but not one of them has ever been seen by me! Either they don't exist or I am always in the wrong place at the wrong time!

I will leave it up to each individual to determine what is real and what is not. Most people are not in the same place at the same time, so they cannot ethically deny the experiences of others!

Anyone who has not experienced what someone else has should either research the backgrounds of other people or get on with your own life as that is the most important thing to you! It is yours and should be enjoyed as much as possible with what you have left.

This should be an open discussion for all those who are interested in this subject. Those who are not interested in taking this further should concentrate on their families. That is what makes Australians Australian in Australia! It's being one country that accepts everyone just as they are – even 'aliens' from other countries of our world – our tourists in particular!

## Ion-Clad Technology

Posted by tufolib on July 29, 2014 at 1:10 PM

Having been interested in physics since 1964, I am interested in propulsion systems, which have been described in great detail by other people. After all of this time, I have come to the conclusion that nothing in this Universe is impossible if you know the right answer!

Lightning has fascinated a lot of people for a very long time, and I am no different – especially as I have been playing around with static electricity for a long time. I have even designed a static electrical discharger, which is basically a neon and a resistor inside a pen case with metal ends – just like an electrician's test probe, only for much higher voltages.

That was inspired by a government building with nylon carpet that created a massive amount of static electricity! When I walked up to the lifts in the hallway, I was quite adamant that I wasn't going to touch the metal plate around the lift buttons!

I very carefully put my finger in the exact centre of one of the plastic buttons, but didn't expect to see Sydney's fireworks on New Year's Eve! Actually, it resembled a gas flame on a stove plate!

As for so-called 'secret' propulsion systems, I have seen one diagram that shows a capacitive effect where ions are separated. Of course, this creates a potential that can flow between the negative and positive stores of energy, so anything that is in the way of these can get dragged with it!

No flames, no smoke, no fuel as such, and no sound. However, I have also heard about sparks, which is what static electricity is all about – the flow in the built-up of the charge, better known as discharge!

It has been claimed that an ion engine creates 55 times more propulsion than an existing jet engine, but we won't be seeing planes, cars, trucks, buses and trains with ion engines anytime in the near future, despite a looming oil crisis! I think crop fuels will take over to prevent energy-dependent companies from losing their jobs!

## Beyond Belief

Posted by tufolib on August 5, 2014 at 10:35 AM

I don't remember ever seeing a complete list of unusual 'lights in the sky', but I'm sure there are plenty on the Internet. Because of that, I will create my own, however incomplete it may seem to other observers!

When I say 'unusual', I mean that a vast number of people never look up to see what is above them, and that is probably the main reason why there are so many UFO reports, which turn out to be explainable – especially as satellites, planets and stars.

In fact, having now checked, I found some really good sites, which include –

<http://www.toptenz.net/top-10-common-explanations-for-ufos.php>

[http://www.cufon.org/cufon/ifo\\_list.htm](http://www.cufon.org/cufon/ifo_list.htm)

[https://en.wikipedia.org/wiki/Unidentified\\_flying\\_object](https://en.wikipedia.org/wiki/Unidentified_flying_object)

I will also list some sightings that I have had, or have heard about.

My first sighting was in primary school in 1963, and was observed not only by me, but a few other children – and the Headmaster, whom I asked about the stream of pure white smoke that crept slowly across the sky, directly above us!

About thirty years later, I read a book, which has a reference to an American test plane from that year! I have looked for it again, but haven't found what is listed as an X-15, X15 or whatever! Some day, I will come across it again!

One night in the 1990s, while taking out the garbage, I was walking up the driveway of my home and within the best part of my vision, I saw a 3-second flash, which looked like a meteor, except that a few pieces of something exploded behind it, just before it burned up! My reasoning ever since is that it could have been a piece of rock with a hollow part inside, or a container of some sort from a space craft.

In any case, it would need to have gases inside, which would expand in the tremendous heat generated by re-entry, and build up so much pressure that the container would have to explode!

More recently, I was alerted to a light, which was changing colours and spinning around, making it look like a 'UFO', whatever that could mean! In this case, it was an Unusual 'Flashing' Object. Having immediately checked a star map, I discovered a star that I hadn't known about – Miaplacidus, which was down in the city pollution, just above a mountain top to the south.

What a spectacular sight! If it was an exotic dancer, she would have been opening and closing a changing, multi-coloured shroud around her as she spun on the spot! Of course, I have also seen lots of slow-moving satellites, and even a meteor that passed through the field of view as I looked in someone's telescope on a public night!

Forget television – go out and see the best shows on Earth, especially when aurorae appear! Oh, yes – I have also seen a few of those, as well as transits and eclipses, which can be found through this link –

[http://rwt.customer.netspace.net.au/science/r\\_aurora.html](http://rwt.customer.netspace.net.au/science/r_aurora.html)

However, nothing has ever come close to this for me –

<http://rwt.customer.netspace.net.au/articles/lights.html>

## Body of Light

Posted by tufolib on August 19, 2014 at 9:55 AM

Synthetically created materials that glow in the dark are definitely not new, having been around for at least several decades! There have been some reports of UFOs that emit light from the skins of crafts – as though the glows are not actually lamps, but something emanating from the bodies of crafts.

Other reports have appeared about light beams extending only so far, then cutting off, which will require a very technical explanation! I still have no idea how that is really possible, but I imagine that photons are programmed or focussed in some way to stop at a certain time (or frequency) after being emitted by some unfamiliar source!

Not only that, but I'm not sure if anyone said that the light felt hot or cold when it enveloped observers and abductees! I can only go by what I have read about recently – that it felt different to be in close proximity to a UFO. However, that was just one experience!

Anyone who has looked at a small, but clear LED (light-emitting diode) close up will have noticed a tower on one side of a standard, bell-shaped lens and a dish on the other side. Looking closer still, two very fine wires will be seen to connect the two sides, but the glow comes from the dish. The coating of special chemicals is what creates the glow when an electric current is passed through it.

Making a material that glows instead of installing lamps behind that material is very easy! All that is required to simulate the glowing body of a UFO is to encase an array of LEDs in a block of epoxy resin, just like surfies do to encase polystyrene foam in fibreglass and resin.

The specifications of the LEDs would change by no longer having magnifying lenses, but an overall glow from the bank of LEDs, and would be transmitted on a 180-degree, vertical arc from a flat plane, all the way around a full circle of 360 degrees!

The specifications of the LEDs would change by no longer having magnifying lenses, but an overall glow from the bank of LEDs, and would be transmitted on a 180-degree, vertical arc from a horizontal plane, all the way around a full circle of 360 degrees!

Come to think of it, I have never seen a glowing surfboard at night, powered by solar panel and LEDs! I doubt very much if that would be a good idea unless the intention was to attract sharks!

## Calling All Believers!

Posted by tufolib on August 27, 2014 at 8:25 AM

Now there's something that seems to be unusual, but probably isn't – directing sound in the same way as light has been done with lasers!

I have experienced this a few times in the last ten years or so when someone used a party balloon filled with carbon dioxide to focus sound very sharply into a narrow beam! This is the concept that I have just read about in a book on ufology to explain why people who believe they are abductees are the only ones to communicate with whom they believe are aliens.

(To remain independently scientific here, I still have to only state what I have read about rather than what I could believe or disbelieve in without having personally encountered the events of others! In other words – don't shoot the messenger!)

For anyone who still doesn't fully realise, electromagnetic energy can come in many forms – like light, heat, sound, magnetism, gravity, x-rays, ultrasound, radio, TV etc. In fact, I think there are many more than I am familiar with, but basic senses of the human body are what most people can relate to.

What I have been telling people for decades is that electromagnetic radiation at any frequency has the same basic properties. However, "different horses for different courses" still applies! This is also why there is not a lot of difference between the red light of a rainbow in the sky and infrared light next to it – or ultraviolet light on the bottom side of a rainbow!

It's just that our vision is woefully limited in the frequency spectrum, and can be likened to those infinitesimally small penlight torches that Dana Scully and Fox Mulder use in the X-Files! In fact, they are considerably worse off than those massive tubes of batteries that movie theatre attendants (or ushers) carry around in the dark!

Just because the light beams have a very limited coverage of everything that is around them, that doesn't mean there is nothing else out there – and so it is with sound energy.

I have also done this with moving air in an air cannon! What seems like a column of air moving forward is actually a vortex, shaped like a doughnut that is continually rolling itself inside out and outside in!

People who have seen the "Morning Glory" as it rolls its way over the Australian mainland will know a bit of what I am talking about, but this is shaped like a tyre tube filled with air! (At least, that is more natural and healthier than a doughnut!)

What I am trying to say is that a narrow column of sound, directed at one person who is not standing in front of or behind someone else, will be the only one who can hear those sounds being generated by an operator – in this case, an alien, for the purpose of this exercise!

That is an alternative that I hadn't, but should have thought of in my capacity, to extra-sensory perception! People who claimed to have heard voices in their heads may not necessarily have been experiencing ESP as a result of radio waves transmitted from an alien's brain to a human one – like one two-way radio with an antenna to another!

However, I still believe that we have "wires", "transmitters" and "receivers", given the unusual experiences I have had since early childhood! They simply cannot be explained away as focussed beams of sound when no one else was projecting them at me!

I believe that all forms of energy can be transmitted, received, focussed, hidden and silenced. This appears to have been partly confirmed many years ago by a report of sound being reflected back on itself at the same frequency, resulting in total silence at or near the same location!

I haven't followed this one up, but need to do so in the immediate future! I have been very busy with light and gravity, but must now get back to sound. You will be hearing from me soon, but I won't be limiting myself to a narrow beam. I will follow the usual pattern and radiate in all directions from a single source!

## Rock 'n' Rile is Here to Stay!

Posted by tufolib on September 1, 2014 at 9:55 AM

Did you have a very vivid imagination as a child? Do you still have one now that you're an adult? Some of my philosophies include 'never losing your childhood' and 'never losing sight of where you have been because you won't know where you are going!' Bushwalking is a perfect example of that!

Ancient astronomers had 'very, very vivid imaginations', probably for all of their lives – given the names of constellations. However, some of them bear absolutely no resemblance to their names!

A similar situation exists with many of the rocks on Mars! I have also had a 'very, very vivid imagination' since early childhood, which allows me to enjoy children's books and movies, but how some people can see familiar 'images' in some of the dust-covered rocks on Mars is beyond me!

Sure, I see shapes in many shadow puzzles, but some of the photos and videos on the Internet leave me gaping – and for more information! Even when we are guided through the process of interpretation, still nothing often eventuates. This was recently the case with a supposed alien skeleton on Mars, but all I could see were channels in the rocks, carved out by either water in the past or repeated sandblasting, which many vehicle bodyworks mechanics would probably drool over!

I have included a perfect example in a NASA photo, which cannot seriously be interpreted as the head of an alien! Sure, it vaguely looks like one – and many other images look like lizards, rodents or people, but I cannot

immediately explain these in great detail because I was not riding on the back of NASA's Curiosity Rover on Mars at the time!

[http://www.huffingtonpost.com/2013/11/19/aliens-on-mars-photos\\_n\\_4303447.html](http://www.huffingtonpost.com/2013/11/19/aliens-on-mars-photos_n_4303447.html)

(In the link, click on the 8th photo – the 'alien head'.)

Of course, I cannot possibly commit myself to conclude anything at this time about some of the most amazing shapes on Mars, despite the possibility that if there was water on Mars at some time in the past, there could have been a prolific amount of life!

Until someone puts another probe there to thoroughly analyse high-quality evidence, we will all have to be satisfied with our 'very, very vivid imaginations' - or 'wild fantasies', which humans love to invent for pleasure!

## The Grange Playground

Posted by tufolib on September 20, 2014 at 5:55 PM

At last! I have read the information panels in The Grange Reserve's playground, thanks to Talk Group Australia's documentary, which I have now seen!

The shapes of the 'UFOs' as described by witnesses in Shane Ryan's documentary only formed vague images in my mind, but they were still close to later descriptions in recent articles. I hadn't realised for a long time that 3 objects were seen, or that they were so big! Just as amazing is a ring that remains on the ground, which is shown in Talk Group Australia's documentary!

Next year, I plan to visit Victoria again, to visit and revisit places that interest me – and there are many of them, only several of which I have seen! Melbourne used to be my 'second home' when I had a job, but it wasn't until about 18 months later that I started on the road to UFO investigation. This doesn't include an advancing stream of white smoke, which turned out to be an American test plane in the early 1960s!

Maybe I will get to see more lights in the sky, because Tasmania has been left behind with genuinely-weird UFO sightings! I have only seen 2 very fast objects with 3 lights on each – 1 pulsating at about 1 cycle per second. They crossed paths during their 10-second, horizon-to-horizon trajectories in 1978 – at the same time as the New Zealand ones!

## Ancient Technology

Posted by tufolib on September 21, 2014 at 8:45 AM

I've read and watched a lot about ancient technology, but there doesn't seem to be much proven and globally-accepted evidence of advanced kinds, only ancient references and modern disclosure in many cultures. Where did it go, if it existed?

Something obviously inspired ancient people to record their views about technology, which appears to have been beyond many of those people at the time. If other people in control of their advanced technologies had recorded their lifestyles, we wouldn't be studying ufology in the way that we are today!

Who's to say that the human race hasn't existed before, blown themselves up and started all over again? I often think about those possibilities, which may have occurred not just for thousands of years, but millions, during which time, the Earth's volcanic activity eventually wiped out any evidence of their existence!

Who's to say that many of those people did not escape natural disasters by fleeing in what we call UFOs, only to settle into their new lifestyles in space around our Solar System? Some people believe that this is what happened to create races of extraterrestrials - as distinct from aliens, said to come from other galaxies!

Are these extraterrestrials really off-shoots of the human race's ancient ancestors - just like dinosaurs, crocodilians and pterosaurs are said to be from their ancestors about 250 million years ago? Extraterrestrials could actually be living in the present alongside us, but other theories support time travel, which some people have also worked out the non-existence of, based on their present, limited knowledge of advanced science!

## Proud and Prejudiced

Posted by tufolib on September 29, 2014 at 2:40 PM

What are the reasons why authorities – as well as people in not-so-high places, clam up – or bite your head off?

When I was in first-year high school, I was a maze of scientific information, despite it being only a fraction of what I know now! In fact, it is safe to say that I know too much – and often wish I didn't! That is partly why I have come a full circle, returning to my childhood to regain my freedom in thinking! Call it imagination, if you like!

On one particular day in a science class, the teacher was trying to capture sunlight in a flat tray with a mirror on the bottom of it to create a rainbow on the ceiling! He sure was having trouble, so I said that I knew how to do that. "No, you don't", he said immediately with a frown and a stern voice! I explained that I had successfully done it on the weekend just gone. My reference was THE HOW AND WHY WONDER BOOK OF BEGINNING SCIENCE, printed in New York in 1960 – one of my all-time favourite magazines.

Of course, we never did complete that experiment in light because he fully believed that he was the teacher, and I was the student there to learn. Apparently, he didn't realise – or want to know, that people – especially in higher places, learn twice – in college and in the field, so-to-speak! Anyone can make people repeat what they say, but no one will ever learn anything properly unless they make mistakes, then find or be given the correct information. That must be embedded into people beneath their consciousnesses!

Why do people struggle alone when they could seek help from others in-the-know? Is it pride? From personal experience – yes, it is, but it is also exactly what I said in the previous paragraph! Unless I am able to work things out my way – not always someone else's, I am rarely satisfied with the answers! It was during this same year that other answers being given were nothing more than diversions!

If only every Government department sought help from people who know more than any one public service employee, solutions would be a great deal easier – and quicker, to arrive at. Quite often, portfolios and other tasks that have never been encountered before, are given to people who have insufficient knowledge about their contents! Some departments actually ask for help, then hide or discard their findings! I think most of us know the reasons for that – national security, cost of food production, conflicting personal beliefs...

I believe that defence forces would often be a lot better off by going fully public and employing selected, knowledgeable citizens who love to investigate unusual incidents! You see it in the movies a lot, but unfortunately, not much of what you see or hear in mainstream media is real. I know that from being "lathered up" when my 'times' arrived. Yes, there have been several, over many decades and the results have usually been the media's ideas about how things should be!

However, any new relationships between 'us' – and 'them' in high places would be exactly what we need to approach problems instead of having authorities hide them away inside cupboards! The only time I have ever needed to apply for Freedom of Information resulted in a very-highly charged confrontation with a young officer displaying sheer anger towards me the whole time I was looking at information about me, but retained by them! Pick your term for this – head in the sand, swept under the carpet, lack of internal communication, inadequacy, peer pressure etc. Why don't authorities simply sacrifice a little pride to gain a lot of cooperation? It can take a tremendous weight off everyone's shoulders!

Sesame Street knows about cooperation, so why do authorities ignore it? Do they think that learning stops at the end of high school? They should watch Sesame Street occasionally because they could learn a lot in a short time! That is where I learned – decades ago, how birds fly, despite reading many books on nature since early primary school. No one explained to me in great detail how things really were, but Sesame Street did! It's as if I was expected to automatically know because I was an adult.

Apparently, authorities need to follow the same principle – open the feathers on your wings to let the air flow through them, then fold them momentarily to capture everything in their paths. As soon as something has been learned from that, let it go so other wings can follow you and learn as well.

Do you see birds crashing into each other as they fly to other locations? No, the ones that follow actually benefit from the leader's slipstream! If only the authorities followed us – the real leaders who pay to keep them in place, we would have one direction in the flock! Here's another term – cut off from the rest of society! That's what they are, but shouldn't be when trying to solve problems!

Why do they do that instead of working with us – and with each other?

## Atom Ante

Posted by tufolib on October 8, 2014 at 3:25 PM (TST)

I found another second-hand book at Salamanca Market. It's a heavy one, too, – not just in weight despite being only medium-sized, but reading as well. However, I haven't started on it yet, so the headaches in trying to understand it will have to wait until I have time for it.

It's called "Not Even Wrong" by Peter Woit, and is subtitled "The Failure of String Theory and the Continuing Challenge to Unify the Laws of Physics". If you have absolutely no idea what I am talking about, consider yourself lucky that you haven't already been dragged into this controversial and popular debate!

Just watching video documentaries on the atom has "enlightened" me greatly, but – as usual, created more questions than answers! Apparently, that has done the same for many physicists around the world, some of whom seemed to have made up their own answers when they all couldn't arrive at the same one!

Maybe this is a throwback to the days when everyone was young and loved to imagine their own little worlds with their own little rules! Of course, this has been going on for centuries, and is most known if you think of Albert Einstein! To get an idea of what I am talking about now, read everything you can about him and you will get a very different view of what the general public still believes!

One of my most favourite – and important philosophies is "Nothing in this Universe is ever what it appears to be." This is definitely true about atoms! Many years ago, the first electronic image was of something that looked like a paper-mache crate of eggs! Then, they started to look like berries of some sort, like raspberries, or whatever!

More recently, someone came up with the idea that there are "strings" inside the atom – "strings", which to me look exactly like those that are fired from an aerosol can by young people with just as much understanding of the Universe as a fish picking at its own waste! You know the stuff that adorns public buildings on the morning after a good night out – strings, not waste!

I sat there and watch these "strings" dance around on my computer's screen, but I didn't understand or relate them to anything that I was familiar with! Were these even real? Maybe not, especially if they were only someone's theory, which has been debunked by Peter Woit in his book that was published in 2006!

Who should I believe? I had never heard of anyone who has dabbled in this subject, and I have never seen an electron microscope image, close up, of what would be purported to be an atom! However, I did save one from the Internet some time ago! I also created my own wallpaper in 1999, especially of oranges, which now look a lot like the rows of gold atoms that this saved image is said to be. You can view my wallpaper here –

<http://rwt.customer.netspace.net.au/fun/wpaper/W-Orange.html>

The main reason for writing this article is the awareness that all hell will break loose when humans finally discover what an atom really is! The real age of Star Trek will have arrived, but its crew will be nowhere in sight. Instead, we will probably continue to have people in high places, many of whom haven't ethically moved towards that lifestyle! Even a little, but persistent investigation will reveal the truth about the current space technology and goals!

## Fairy 'Nuff

Posted by tufolib on October 14, 2014 at 6:07 PM (TST)

Here's a subject for big kids – like me who doesn't believe that science has limits! In fact, science is not in opposition to religion – it's the study of how things are in this Universe, regardless of how they came to be here! Of course, you should already know that believing or disbelieving something without backing anything up without researched facts are limits to what you are capable of. That has been a serious problem for the past few million years or so, but it doesn't have to be that way from here on!

How do you suppose fairies came about? Were they yet another misinterpretation of a life form, or are there really tiny, secret societies somewhere in this world? There are many stories about how fairies look and interact with their surroundings, especially when humans as we know them appear on the scene!

Here's something that I didn't know because I have never researched it before – Tinkerbell, the most famous fairy of all, was not a creation by Walt Disney or his team – she appeared in the play "Peter Pan" by James M. Barrie in 1904. Although I have seen a phenomenal number of Walt Disney presentations – and noticed her alongside Peter Pan, I have never known the origins of either!

Tinkerbell seems to be only one species with a second set of wings, much like a beetle because I have seen quite a variety of them, obviously not as many as there now are on the Internet. More information can be found here –

<http://www.livescience.com/25413-fairies.html>

Many people believe that life was introduced to Earth – some as is, by aliens! Does this mean that fairies could have been also? If you're finding this heavy reading at the moment, remember that science has no limits! The only reason why we mention science is because we haven't figured everything out yet! Science fiction is explainable, especially when a full-sized remote-controlled car featured in one segment from the Science Fiction Theatre in the 1960s! It is then reasonable to say that science fiction is science that we hadn't (or haven't) discovered yet!

Supernatural science can be basically the same as science fiction, except I think it includes perceived reality, especially for adults who just want to get away from the drudgery of present life for awhile! Aren't you glad that you can finally get out of your seat in the theatre and go back to being 'normal'? Sometimes, that is the message on-screen that characters display! Of course, there is always a problem with that after you leave the theatre because humans have such an insatiable appetite for living lives of sacrifices – even to the point of death!

Why can't *Homo sapiens* be more like fairies? Is there no challenge to life in doing so – apart from dodging spiders, ants, cats – and humans as we presently know them? We could have everything we need without trying to change the Universe into something we think we want, but give up on after becoming bored! Will we ever become bored with ufology and just get on with our lives? I don't think so, because wherever wars and natural disasters break out, UFOs appear in our skies!

These may not be UFOs as such – only technology unfamiliar to most of the general public, and an excuse for their manufacturers to test their equipment on in the field. Lots of incidences in the past lead me to believe that this may be the case!

## Design Away!

Posted by tufolib on October 26, 2014 at 5:55 PM (TST)

Many investigators and interested witnesses have noticed that UFOs, visible crafts and orbs are not all of the same design. It won't take much to think that this is because they probably have different jobs to do. However, when it comes down to one aspect, they all have to perform the same basic manoeuvres – surpass Earth's presently-known, aging technology, and fly to Earth's many environments over land, below sea level and into space! It seems time and/or dimension are included here, even though these are still mysteries to most – if not all of the human race!

Having been a designer and creator of many types of equipment since 1964, I am now a very experienced industrial designer who can turn out items, which perform much better than commercial designs because I persist until I get what I want – for awhile! Sometimes, I redesign and rebuild until I run out of ideas to perfect them. However, I still haven't figured out how to get a child's spinning top – and now a "toy" gyroscope I have had for years, completely off the ground, but lately, I have seen some very inspiring ideas!

Is this what the designers of UFOs do? Who thinks up these craft? Who builds them? Where and how do they construct them? How long does it take? The Egyptian pyramids were said to take decades, Henry Ford's first factory-built cars took 21 minutes to assemble and Australia's cars about 10 years from ideas to rollout in the last half of the 20th Century! Someone on Earth obviously knows the answers, given the advanced technology, which is now spread around the world. Apparently, it has been – and for thousands of years, but most of us are still left to wonder! For a great many years, only 98 of a commonly-known 103 elements in this Universe were logged, but as many as 118 are now recognised – a few of the most famous being oxygen, iron and mercury! I have heard as many as 121 in recent years, but some of those have been manufactured by humans!

Also noticed have been solid and flexible skins, or hulls made from a variety of materials – often lightweight. Many have been said to be from familiar metals that can be easily extracted from Earth. Knowing how radiation passes through them in varying intensities, it appears that some cannot be completely blocked by electromagnetic energy, but this is still what appears to be employed as shields, just like the Earth's magnetic field shields us! Have you ever heard of the term 'fighting fire with fire'?

One thing is for certain, all of this material – sometimes with great mass, has to be at least neutralised to float or fly. I haven't heard seriously about gravity being reversed, but now I'm not sure that it is possible because even more energy would be required for propulsion after reversal. Keep in mind that gravity and magnetism are energies just as much as light, sound and heat – all of which can be very easily directed and reflected back into each other, which is why we have mirrors and canyons, antennas and microwave dishes – ovens even, and car alarms, as well as aluminium foil for cooking, wine chillers and picnic coolers!

The most recent developments, which I have not yet studied in great details – only seen in videos and read about, are levitators using high voltage static electricity! Apparently, small objects (mostly) have been levitated because it seems to take a phenomenal amount of energy to overcome some natural forces of this Universe!

Some of the most amazing experiences I have had lots of are when eating potato chips that come in packets made out of UFO material. Isn't that so? When I screw the packet up, it immediately springs open again because it has a built-in memory effect. It's great fun for cats as well.

Actually, it will probably take a lot more energy to publicly release and accept all of this information – and more, so the best sources of that energy can only come from every person living on Earth! Two heads might be better than one, but several thousand million would have to be the ultimate!

## Science Friction

Posted by tufolib on November 7, 2014 at 4:05 PM (TST)

How many people have stopped to realise that if friction didn't exist, everything would disintegrate and drift away, probably as sub-atomic particles? It has been shown that there is an attraction of at least one molecular compound with two basic elements – besides the nucleus/electron attraction! One astronaut shook common salt made of sodium and chlorine, which clearly demonstrated the properties of "attraction" and "cohesion"!

Water has also been shown to seek out its own kind (at least), but then anything that is alien to Earth has fascinated many human beings – not all, because some people who don't understand anything foreign are usually frightened or have something more interesting to do for themselves!

Way back in high school in the 1960s, I learned about words that I wasn't supposed to use in front of primary school children. They could have been overcome by something that was ahead of their time – believed to be undeveloped brain cells! However, I have more recently mixed with 6-year-old kids who have been telling me about University stuff!

Also, how can kids develop brain cells unless they are exposed to information, which they have never encountered before? I was usually surprised when over-caring (not necessarily overbearing) mothers were surprised or stepped in at the sound of words their children had never heard of. You could also think of that as friction!

How else could all of this apply to UFOs – or Earth-bound crafts that don't look like anything, which most of the general public are familiar with? Let's start with the nose cone, or the leading edge of any road vehicle or marine vessel, which cuts into the Earth's atmosphere or seas!

I have shown children how the front ends of different boats affect bow waves, using wooden blocks with different shapes. These included a horizontally-flat one and a roof-shaped one – probably two with one having a sharper point than another. Each boat was pulled along a trough of water, taking different times to arrive at the far end because of the surface area and angle in the water!

I don't know of anyone who hasn't seen videos of NASA's space shuttles returning without engine power to Earth – and the brilliant glow of the underside covered with tiles, some of which have been coming off in the heat generated by friction at high speeds in the atmosphere! How do UFOs prevent that? Apart from not having tiles, I have heard about magnetic shields, which are said to be spaced out around the skins of vessels.

How far that it is, I have not yet properly investigated, but as an electrician from the distant past – and playing around with electronics again after a long break from the 1970s, I can tell you that it doesn't take much to create an insulator of electricity! A vacuum or some corrosion can slow down or stop electrons and their wave power from being transferred between two conductive metals or liquids.

Come to think of it, I remember building a UFO detector that I found the instructions for in a 1970s electronics magazine! That was a lot of fun and a bit of valuable experience, but I couldn't test it in the field. Why do you think that happened? Sometime after that, I heard that a university had an earthquake detector that was so sensitive, cars moving around the car park were being registered.

How these tie in with friction, I am not quite sure at the moment, but I do know that everything in this Universe is connected. For cohesion to readily occur, there obviously has to be more of that than friction. I have demonstrated attraction using oil, which contained magnetite, and brought a magnet close to them. This could be unnerving for people who couldn't handle the black oil in the X-Files!

I also love to demonstrate this using two bar magnets on a carpet or mat where there is a lot of friction. You can do the same and be amazed if you lay one magnet down on the carpet, then stand the other up at an angle, near the end of one pole, – like Evil Knievel on the back wheel of his motorbike.

After awhile, you will discover which poles to use close to each other and how far away the balancing magnet must be from the one laying on the carpet. You cannot perform this 'trick' without friction – or with it! If friction didn't exist, the carpet would have no effect, and the magnets would smash into each other.

Another of those 'unwritten' laws of the Universe is that nothing is all one way and not the other, but in various states of existence at various times because of various conditions around it. These include the different forms of energy mentioned in another article, you know – light, heat, sound, magnetism, gravity etc.? Not only that, but one of my favourite quotes variously goes something like "nothing in this Universe ever stays the same" and "nothing is what it appears to be".

I hope I haven't created any unnecessary friction by writing this article!

## Can You See Me?

Posted by tufolib on November 16, 2014 at 8:35 AM (TST)

Who would like to be invisible?

Given the predictability of human nature by movie screenwriters – I don't think that would be a good idea! Look at all the trouble we have heard about from people who said they have been abducted? Many of us would obviously misuse it as much as occupants of UFOs are said to do! Present-day humanity has a long way to go before it can earn the privilege of working alongside the crews of Star Trek missions, hundreds of years from now!

There are some brilliant books around – one being "Sight Unseen" by Budd Hopkins! He wrote the first part of this dual-theme book, with the second part being written by Carol Rainey. She concentrates on hypnotic regression, but invisibility is why I bought the Kindle version. I did so because I have had my own questions and theories about the reports that have been coming in from around the world.

As with everything in this Universe, nothing is fully one way or the other – and light is definitely no different. This book seems to cover everything from the familiar mirage to the alien in the movie, "Predator", where the cloak used is not totally invisible, to partially-transparent and cloudy images that look and act like holograms.

It also describes the way in which cloaking is possible for one secret aircraft by having light wrap around the body of this plane in the same way that starlight is bent through the Earth's atmosphere, enabling us to see stars that are actually behind it. This is not an unusual occurrence as that is similar to what industrial designers see when smoke is introduced into the airflow of a wind tunnel. Moving air will stay close to a surface when passing it.

In easy text form, I can demonstrate this, where the 'vertical lines' and 'parentheses' represent the light folding around the uppercase letter 'O'. The 'hash' character at the top represents a distant object where light is reflected, and ends up on someone's retinas at the bottom. Because the light folds neatly around the letter 'O', all that should be visible are exactly the same photons of light coming from the distant object that is not in a direct line of sight.

These photons would block the letter 'O' – right in front of us if secret government departments do not want the general public to see it! Of course, light being what it is, it radiates in all directions when not being focussed as it is in a laser beam, so the letter 'O' should be invisible from all directions – horizontally and diagonally, at least on this page!

#  
| |  
(O)  
| |  
#

The point is – and I have been telling adults and children about this for many years, that light must travel from one place to another when someone whom I could see would be 'over there', and I would be 'here' some distance away. Without light travelling, how could my eye be able to see someone with a parachute at a few thousand feet in altitude, for example?

Of course, no one can see light because photons are just too small, but we can see the effect they have on everything that gets in the way of them! In a sick sort of way, no one can see the first, tiny strands of mould on bread or fruit until they are packed so tightly that it is impossible to miss them the next day!

In one documentary, light was said to occupy an area at the rate of only a few photons per square centimetre in any one instant, but when they are coming at you at about 186,282 miles per second or 299,792 kilometres per second, working out the number of them passing that point should be a headache for most people!

Hopefully, the subject of 'invisibility' should be as clear as daylight to you now!

## Skin Deep

Posted by tufolib on November 24, 2014 at 8:20 AM (TST)

All of the alien-related information throughout the world has been going around and around inside my head for decades! Who aliens really are and what they are doing to us (or for us) have been in the forefront of my mind in short bursts of concentration, dozens of times since first hearing about them.

However, in my early years, I used to shrivel up at the thought of potentially encountering them "in real life" – not because of personal experiences, but just hearing people say that they have been involved in some way, especially alien abductions and/or being taken for rides in UFOs!

I was brought up in western civilisation, most of which still refuses to accept the existence of aliens, so being influenced by the views of people who have never studied the subject, I was left with their outfall to automatically cringe (not actually subconsciously) at the sound of alien abduction! The truth is that I had never sufficiently studied ufology either – up until 1979, so I have never been qualified or experienced enough to justify cringing prematurely!

Having eventually been uncomfortably aware of this, I knew something had to change, and as whatever happened to the people who claim to be abducted, they couldn't change their "past" anymore than scientists could around the world who are working on that aspect. (I can't use the word "problem" here!)

After several years of changing – and cringing at someone's disclosure in the 1990s, I have changed to accept that I can't prove that their disclosure was a figment of their imagination, but they still can't prove that what they were saying actually happened. Therein lies a "problem" – not just one "aspect" of their lives! They can choose to tell people about it and ignore the ridicule by others, or keep quiet for the rest of their lives!

Just seeing a UFO can still be damaging enough when friends get hold of the story, but actually meeting or being experimented on by beings who don't look human would be a nightmare! I can only imagine this, not having any experience in this field. This is why I have thought about the physiology of what we know as aliens, strengthened by many reports – not including the now-believed-to-be hoax of that famous alien autopsy video! On its release, I watched it through a hole in a 'brick wall' that I had placed in front of my eyes! Even though questions immediately arose, my body didn't cringe now, but my mind still did!

That brings us to the main point of this article! How do the bodies of aliens work?

I have heard a lot of theories, but never seen an authorised autopsy of an alien. (Why is that?) However, for some weird reason, as a kid, I used to watch television documentaries about doctors performing surgery on patients to gain a better knowledge of human physiology. I can tell you that I didn't just sit there without cringing sometimes –

If you like the way you look in the mirror at the moment – apart from first thing in the morning, enjoy it because humans are not the be-all and end-all of life! We are simply in the present, and on the way up to somewhere else! Nothing in this Universe ever stays the same!

## Christmas

Posted by tufolib on December 22, 2014 at 6:15 PM (TST)

Maybe I should write about this, and maybe not, but I think I will because it has been around for a long time! Someone in the 1990s told me about a very sensational book, which tells of a very different story about Christmas. I have read it at least twice, although the author recommends ten times to take it all in!

Some parts remain almost incomprehensible, but most are logical if we think about modern technology, which is either now in use or being fine-tuned before its possible release to the 'outside world'. There have been many stories about the origins of Christianity, but all we have now are clues, which of course, have a vast number of interpretations by nearly as many cultures!

This story starts off like many Hollywood movies by getting to know the characters involved, but as the book from the author's memory progresses, it becomes more and more interesting! It is a journey of what could be described as pure fantasy, which movie makers on Earth love to create, but near the end of it, it is literally 'off this planet'.

What is purported to be the 'the real truth' is given to the author, and includes information about what the Star of Bethlehem really was, and what really happened at two events – about 33 years apart! Lots of people won't like this story, which I have never shared with anyone else because I still haven't come to any conclusions about it.

Being a very logical scientist, I am still not prepared to do that about lots of things, but I sure have been swayed side-to-side a few times! I grew up believing in science because it was so much fun, but I also learned a lot and now question it in greater detail. Some things still don't add up!

I need to live another lifetime to take in most of what I have learned in this one!
